Fenror7 reduces the average internal threat detection time from months to hours

By using a game changing approach to lateral movement detection, Fenror7 provides near immediate detection of internal cyber threats, helping our customers avoid the unnecessary costs of late threat detection.

**Easy to read results**
Detecting threats and seeing the bigger picture of security alerts can be a time-consuming task which even highly trained incident response and security specialists often find difficult to complete quickly. Thanks to our easy to read clustered event map, security personnel can immediately identify threats and prevent further damage to the organization.

**Network based solution**
Fenror7 uses proprietary technology to examine network traffic and detect fundamental attack concepts instead of trying to keep up with identifying the zero-day of the week.

**Multi-site enterprise solution**
Fenror7’s multi-site enterprise solutions provide a single management point for multiple engine servers. Our scalable multi-site solution is designed for enterprises with data centers spread out over multiple geographic locations, and consists of a multi-site management server connected to detection engines installed at each data center to provide a single – easy to read – view of internal threats against your organization’s network.

Reveal undetected cyber threats as they move

Your network is constantly changing
We understand that today’s networks will change significantly by tomorrow, and that keeping up with every new device or technology that connects to it can sometimes be impossible. That’s why we designed our products to be completely independent of the types of devices connected to your network without relying heavily on benchmarking existing network behavior.

From ransomware to targeted attacks
Whether dealing with ransomware or any other type of targeted attack, from the moment attackers breach the perimeter, they will need to move laterally within the network. That’s why being able to detect lateral movement quickly and efficiently is a crucial part of defending your organization and customers.

Compatible with prevention systems
Fenror7’s products enhance the capabilities of existing threat prevention systems by integrating with them to provide our clients with the ability to react immediately to internal threats moving through the network.

About Fenror7
Armed with the understanding that existing security solutions do not provide the expected fast, consistent and effective detection of internal cyber threats, Fenror7 set out to provide a better and more efficient way to solve the problem by addressing it from an attacker’s point of view. While other solutions attempt to detect lateral movement based on techniques that rely on end-point solutions, signatures or user behavior, we reveal undetected cyber threats as they move by detecting attack concepts which can’t be avoided or easily disguised as the attack spreads out through your network.
